Abstract of TW442743

The present invention relates to an information delivery agency (IDA) system that receives the information requested for delivery through a network by the deliverer before, in accordance with the deliverer's required selection conditions, and forwards the information to the required receivers. The IDA system should at least include a front-end agency device and several IDA devices of the receiver database. The front-end agency device receives the receiver selection conditions set by the deliverer and the information to be delivered. The IDA devices select qualified receivers from the receiver database to create a receiver list before for delivering the converted or non-converted information requested for delivery by the deliverer to the receivers in the receiver list through the network.
